

Panadero System

Bakery Inventory & Order Management Platform • Project Overview

1. System Overview

The **Panadero Bakery Inventory & Order Management System** is a centralized web application designed to digitize and streamline the daily operations of a modern bakery. Managing daily baking batches, stock levels, and customer orders manually often leads to stockouts, ingredient spoilage, and lost revenue.

This system solves these problems by providing real-time inventory tracking, structured order processing, and distinct role-based access. It ensures that the bakery owner, baking staff, and customers all have accurate, up-to-the-minute data regarding bread availability and order statuses.

2. User Access Levels

Admin (Owner/Manager)	Staff (Baker/Cashier)	Customer (Buyer)
Complete system oversight and administrative control. - Manage all user accounts - Add/edit bread categories - View overall sales & logs - Monitor inventory batches	Operational control for day-to-day bakery tasks. - Input fresh daily batches - Update stock quantities - Process customer orders - Update order statuses	End-user interface for browsing and purchasing. - Browse real-time catalog - Search for specific bread - Place reservation orders - Track order completion

3. Core Capabilities (CRUD)

- Create (Add):** The system allows staff to register new daily baking batches with precise quantities and expiration dates. Customers can create new purchase orders directly from their dashboards.
- Read (Display):** Users are presented with a clean, dynamic data grid showing available bread products, current prices, and live stock levels. Admin users can read detailed system logs.
- Update (Modify):** Staff can quickly update the status of an order (e.g., from *Pending* to *Preparing* to *Ready*). Admins can update pricing to reflect ingredient costs.
- Delete (Remove):** Admins can remove discontinued products from the catalog or cancel invalid/duplicate customer orders to keep the database clean.

4. Advanced Features

Beyond standard data entry, the system improves operational efficiency through built-in search and filtering mechanisms. Users can utilize a **Search Engine** to instantly locate specific products (e.g., typing "Pandesal") across large inventory tables. The **Filtering System** allows users to sort items by Category (Sweet Breads, Savory, Pastries) or by Availability Status (In Stock, Out of Stock), enabling faster decision-making.

5. System UI Dashboard Visualization

Below is a conceptual visualization of the Staff/Admin Dashboard. It demonstrates the structural layout, including the side navigation panel, top-level metrics, and the main data grid where real-time CRUD operations take place.
