PANADERO

System Features Documentation

Customer, Staff, and Administrator Workflows

University of Cabuyao • College of Computing Studies • Version 1.0 • 12 October 2026

SCREENSHOT NOTE

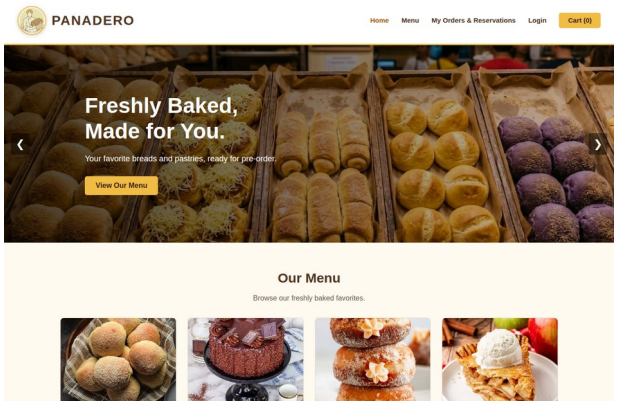

Screenshots show the supplied PANADERO HTML/CSS/JavaScript pages with isolated local preview fixtures. Example names, prices, counts, and request references are illustrative only; they are not live customer records or a database acceptance test.

Feature index

Feature	Role	What it does	Data processed → output
F-01 Storefront & catalog	Visitor / Customer	Open the storefront, browse categories, search products, and review prices/availability.	Catalog category/product data → browsable cards and stock cues.
F-02 Customer account	Visitor / Customer	Register, sign in/out, and submit a password-reset request.	Account/contact details → session or validation response; password is hashed server-side.
F-03 Cart & checkout	Customer	Edit cart quantities and choose pickup/delivery and payment method before sending an order.	Product IDs/quantities and fulfillment details → confirmed order reference and saved order lines.
F-04 Reservations	Customer	Select a product and quantity and request a preferred date/time.	Contact, item, quantity, schedule → reservation reference/status.
F-05 Customer tracking & notices	Customer	Review own orders/reservations and read completion notifications.	Authenticated user ID, request status, notification state → filtered status cards.
F-06 Staff dashboard	Staff	Review stock/request summaries and recent requests.	Inventory and request metrics → dashboard cards/list.
F-07 Inventory & batches	Staff	Adjust product stock and record new baking batches.	Product, quantity, baked/expiry dates, notes → stock update and batch history.
F-08 Request processing	Staff / permitted Admin	Search/filter active requests and move them through allowed states.	Request reference/type/status → validated status update.
F-09 Admin management	Administrator	Maintain supported catalog, category, user, and stock data and inspect request summaries.	Shared operational data → saved changes and admin overview.

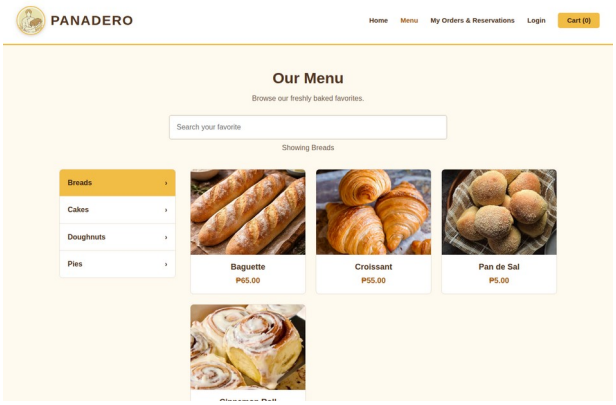

Status flow documented in the API: Pending → Preparing/Processing → Ready → Completed. Cancellation is restricted by route rules. Payment gateways/card processing are outside the supplied implementation.

F-01 | Storefront and product discovery

Storefront home — customer entry point

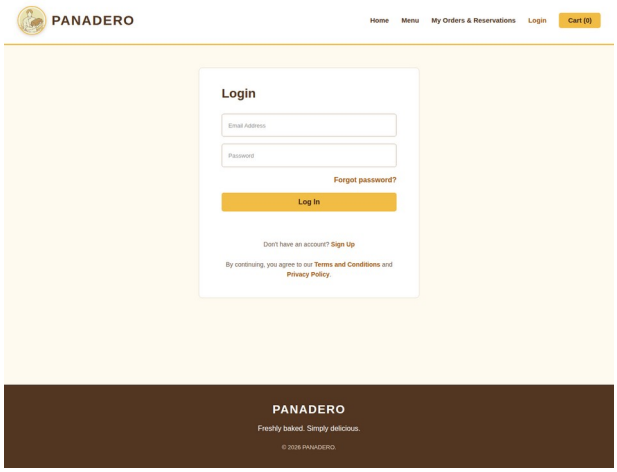

Visitors use the landing page to reach the bakery catalog and customer workflows. Data: static storefront content plus catalog entry links. Output: a clear starting point for browsing.

Menu — category filter, search, and product cards

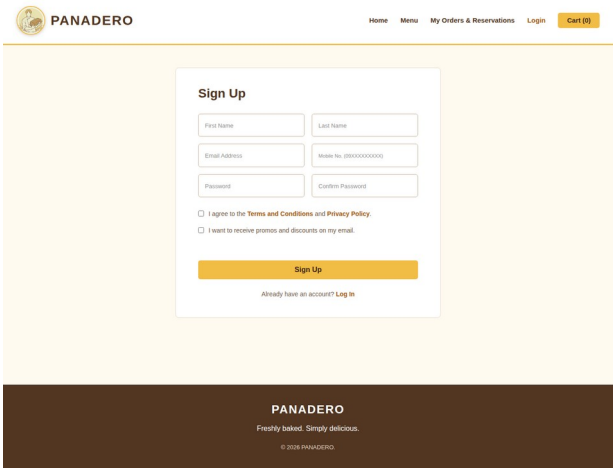

Customers browse category-specific products, search, and inspect product images, prices, and stock cues. Data: category and product catalog. Output: filtered product cards and item-selection links.

F-02 | Customer registration and sign-in

Login form

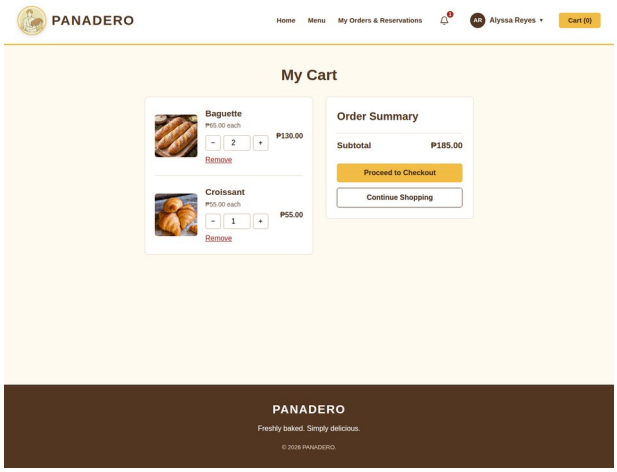

A returning customer enters an email and password. The API validates credentials and returns a session; invalid input produces a message. Password reset requests return a generic response; no email-delivery service is documented.

Customer registration form

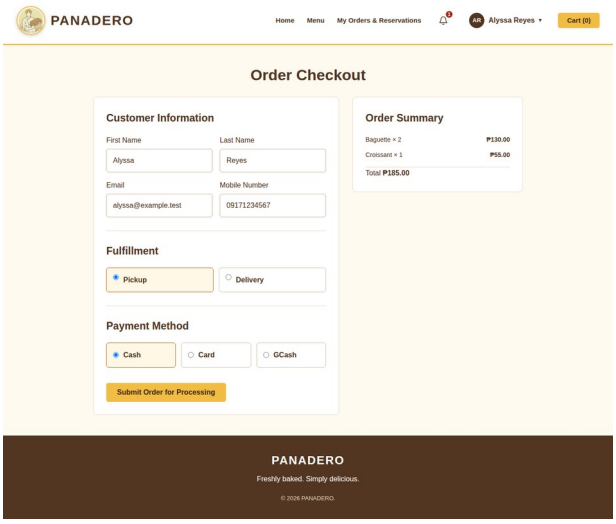

A new customer enters name, email, mobile number, and password and accepts the displayed terms. The API creates a Customer account and stores a password hash, not the raw password.

F-03 | Cart and order checkout

Cart — editable quantities and subtotal

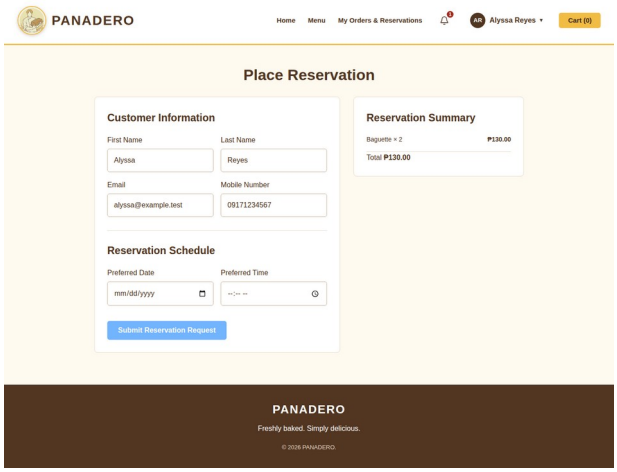

The customer changes quantities, removes items, and reviews the subtotal before checkout. Cart data is held in browser storage; stock and price are revalidated by the backend at submission.

Checkout — customer, fulfillment, payment choice, and order summary

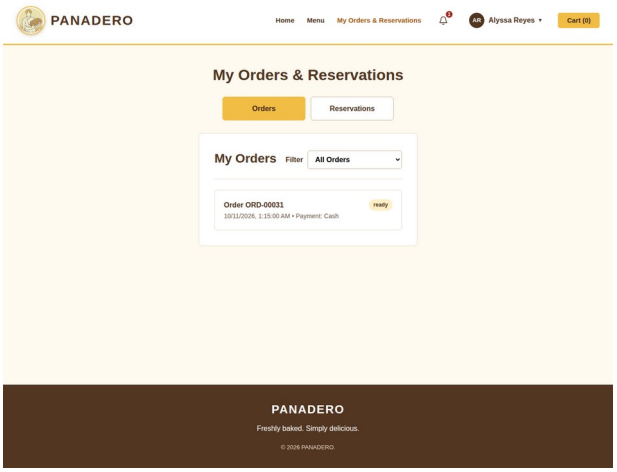

The customer reviews contact information and chooses pickup/delivery and a payment method. The server recalculates totals, checks stock, writes the order and line items, and reduces stock in a transaction.

F-04 / F-05 | Reservations, tracking, and notifications

Reservation request — product and preferred schedule

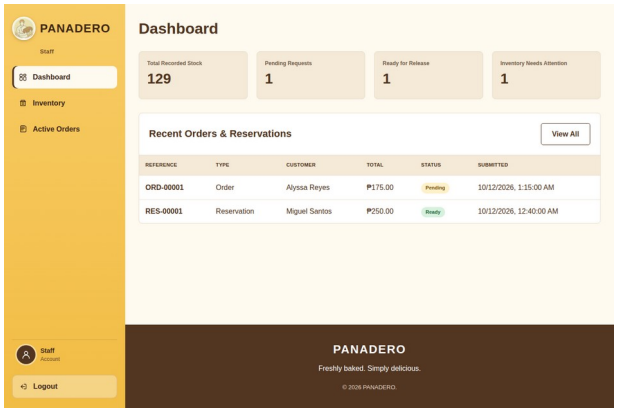

The customer supplies contact details and a preferred date/time for the selected product and quantity. The backend returns a reservation reference/status. The preview leaves date/time blank for demonstration; the form validates a future schedule on submit.

My Orders & Reservations — account-scoped tracking

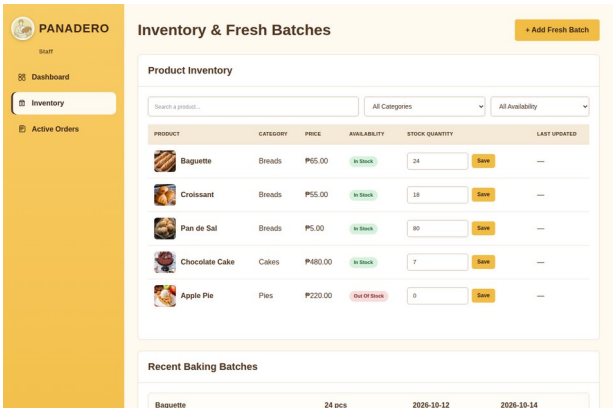

A signed-in customer filters their own requests by status. The preview shows one fixture order card and a notification badge; reservation history appears under the Reservations tab. Completion notifications can be read/marked read.

F-06 / F-07 | Staff dashboard, inventory, and baking batches

Staff dashboard — operating summary

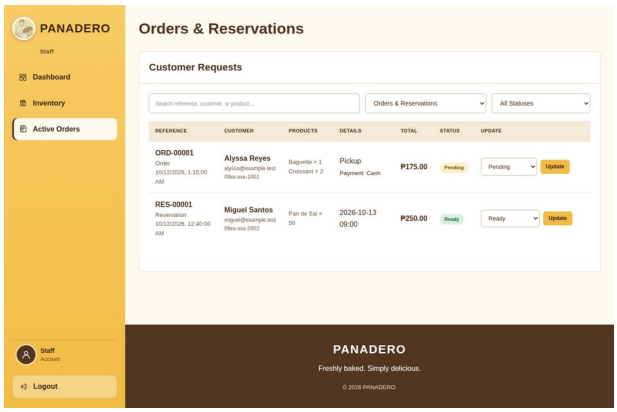

Staff review stock/request counts and recent customer requests. Data: products, quantities, request type/reference, totals, and status. Output: a quick operational summary.

Inventory — stock and fresh-batch management

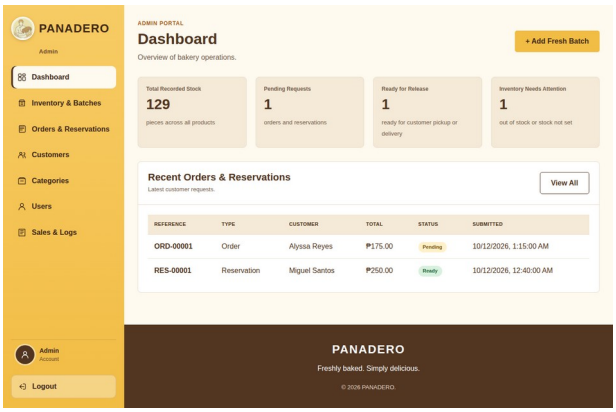

Staff search/filter products, save nonnegative stock, and record a batch with quantity, baked date, expiry date, and notes. Batch creation increases stock and preserves a batch-history row.

F-08 / F-09 | Request processing and administration

Staff request queue — orders and reservations

Staff search/filter requests and advance them through allowed status transitions. Data: request reference, customer, items, schedule/fulfillment, total, and status. Invalid/backward changes are rejected.

Administrator portal — shared system management

Administrators review the overview and navigate to supported category, product, user, stock, request, and summary views. The current system_logs table exists, but the admin state returns an empty log list; full audit-log writes remain future work.

Verification note: these screenshots document frontend screens and fixture rendering. They do not claim live-database execution. The UI evidence covers the main customer, staff, and admin feature groups; not every validation/error state is pictured.
